

Meteosat Third Generation (MTG): Background and upcoming applications

**Stephan Bojinski, Federico Fierli, Sally Wannop, Mark Higgins
EUMETSAT, User Support and Climate Service Division**

**Daide Melfi
Italian Air Force Meteorological Service
Operative Centre for Meteorology (COMet)**

Meteosat Third Generation: Imaging mission (MTG-I)

- Imagery mission implemented by two MTG-I satellites
- Full disc imagery every 10 minutes in 16 bands
- Fast imagery of Europe every 2.5 minutes
- New Lightning Imager (LI)
- **Start of operations in 2022**
- **Operational exploitation: 2022-2042**

Meteosat Third Generation: Sounding mission (MTG-S)

- Hyperspectral infrared sounding mission
- 3D weather cube: temperature, water vapour, O₃, every 30 minutes over Europe
- Air quality monitoring and atmospheric chemistry in synergy with Copernicus Sentinel-4 instrument
- **Start of operations in 2024**
- **Operational exploitation: 2024-2043**

MTG Imager (FCI): Cloud top of convective storms through higher spatial and temporal resolution

Future

FCI imagery simulated over Central Europe based on data from the VIIRS instrument on the NOAA Suomi-NPP satellite; combining 0.865 μm imagery (background) and 11.45 μm (convective storms) to a 'sandwich' product

Courtesy M. Setvak

Current

MTG Imager (FCI): higher spatial resolution imagery

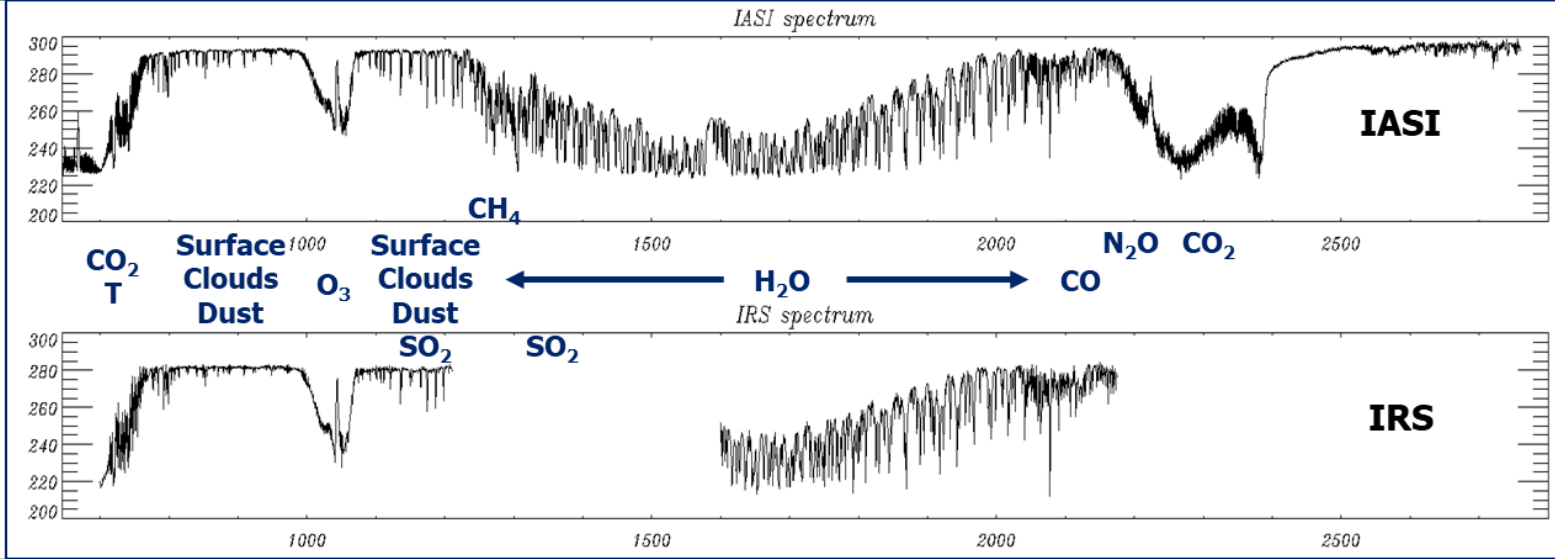

Example of ash detection, SEVIRI Natural Colour RGB, 12:15 UTC, 26 November 2006 (left), MODIS True Colour RGB, 12:20 UTC, 26 November 2006

MTG Infra-Red Sounder (IRS)

4 Local Area Coverage (LAC):

- One LAC acquired within 15'
- Overlapping step & stare dwells
- 160x160 pixels, ~4km at Nadir
- Europe (LAC 4) observed every 30'

**Major innovation:
Operational spectro-
imagery at high spectral,
spatial & temporal
resolution**

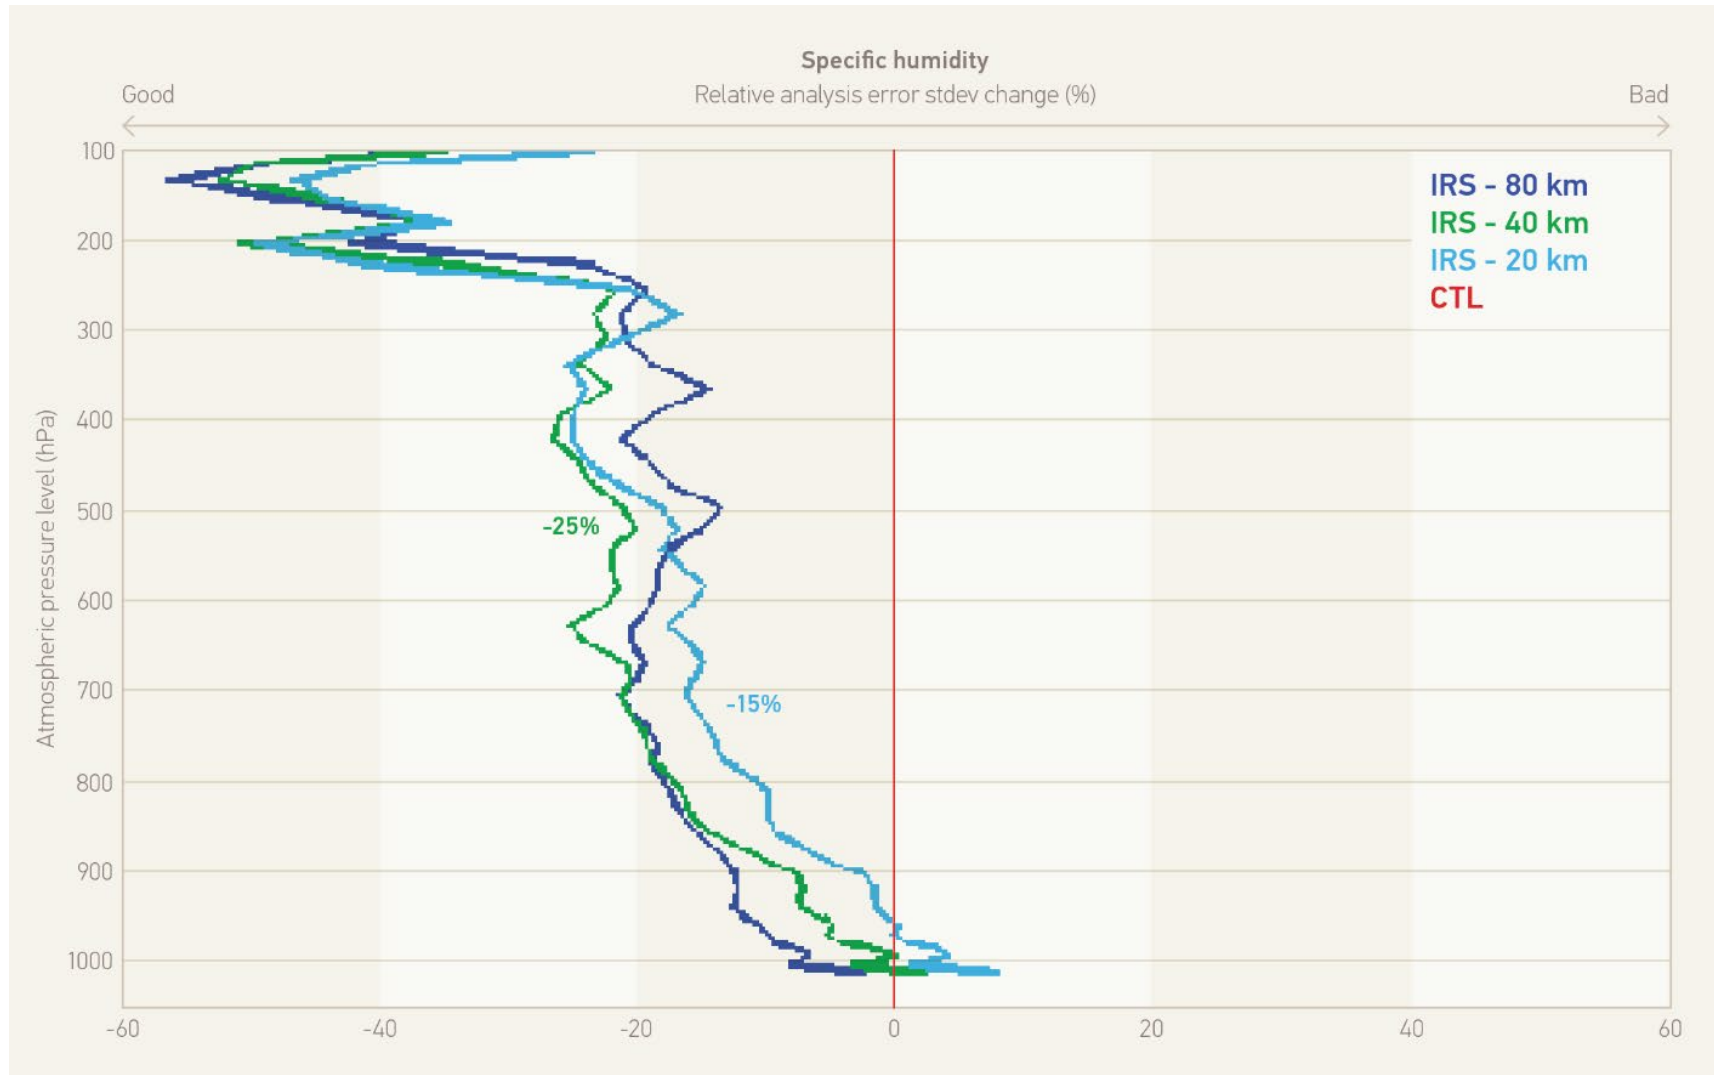

'4D Weather Cube': Probing the atmosphere to detect severe weather

**Enabled by
MTG**

**Every 30 min
over Europe**

MTG InfraRed Sounder (IRS): Enhancing numerical weather prediction

Simulated MTG infrared sounding data have a demonstrated positive impact on regional weather modelling, by reducing the error of forecasting specific humidity and other meteorological parameters

Source: Guedj et al., 2014

MTG Imager and Sounder: Detecting convective initiation

Detection of low-level moisture over Kansas, USA, using the Split Window Difference ($10.35 \mu\text{m}$ minus $12.3 \mu\text{m}$) of NOAA GOES-16 ABI data (right panel, in orange-red colours), a precursor for potentially severe storms, while conventional imagery detect no signal (left panel)

The low-level moisture boundary is evident about 2.5 h before clouds form.

Courtesy: Dan Lindsey (NOAA), 15 June 2017

MTG Imager and Sounder: Tools for nowcasting convective storms

STEP BY STEP DEEP CONVECTION NOWCASTING

Version no. 1, September 2017

1. Pre-Convective Environment

Refers to the 4-D thermodynamic and wind field present before convective initiation occurs.

Useful tools:

NWP data, Radiosonde and aircraft measurements
 MSG GI/RII Product – instability & moisture
 iSHAI Products – instability & moisture
 HRW Product – wind fields
 METOP/IASI level2 – temp & moisture vert. profiles

2. Convective Initiation

Refers to the process where an existing cumulus cloud begins rapid vertical growth.

Useful tools:

Radar, lightning data
 Cloud Type
 Cloud Top Temperature
 Cloud Microphysics
 Convection Initiation – demonstrational
 Optimal Cloud Analysis

3. Mature Convective Storm

Refers to the presence of convective clouds with tops at or above their local equilibrium level.

Useful tools:

Radar, lightning data
 RDT Product – storm tracking
 Precipitating Clouds
 CRR Product – precipitation
 NEFODINA
 Convection RGB
 Overshooting Top Detection
 MSG Sandwich Product (HRV+IR10.8 enhanced)

MTG Lightning Imager (LI): U.S. Proxy Data

- Lightning activity monitored from space (white-blue-magenta in colours) along a convective storm line (yellow-orange-red shades in background infrared imagery) over the Gulf of Mexico.
- Weather forecasters have additional information to more precisely monitor convective development, especially in areas where detection efficiency of ground-based lightning detection networks is lower

Sentinel 4 on MTG-S Sounding Mission

The spatial resolution $\sim 8 \times 8$ km with hourly temporal resolution

First Geostationary over EU

Focus on air quality with the main data products being O_3 , NO_2 , SO_2 , HCHO, and aerosol optical depth.

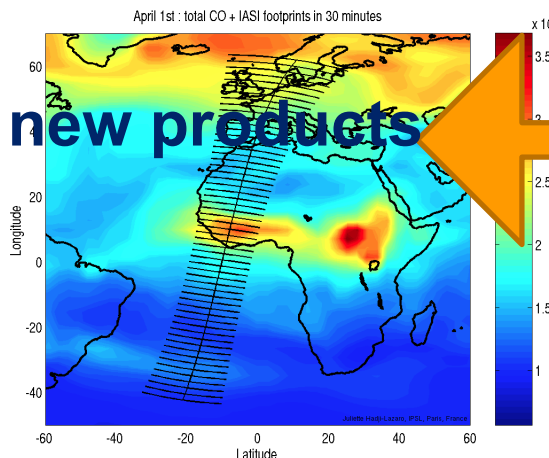

Synergy for new products

Start of operations: 2023

Operational : 2023-2042

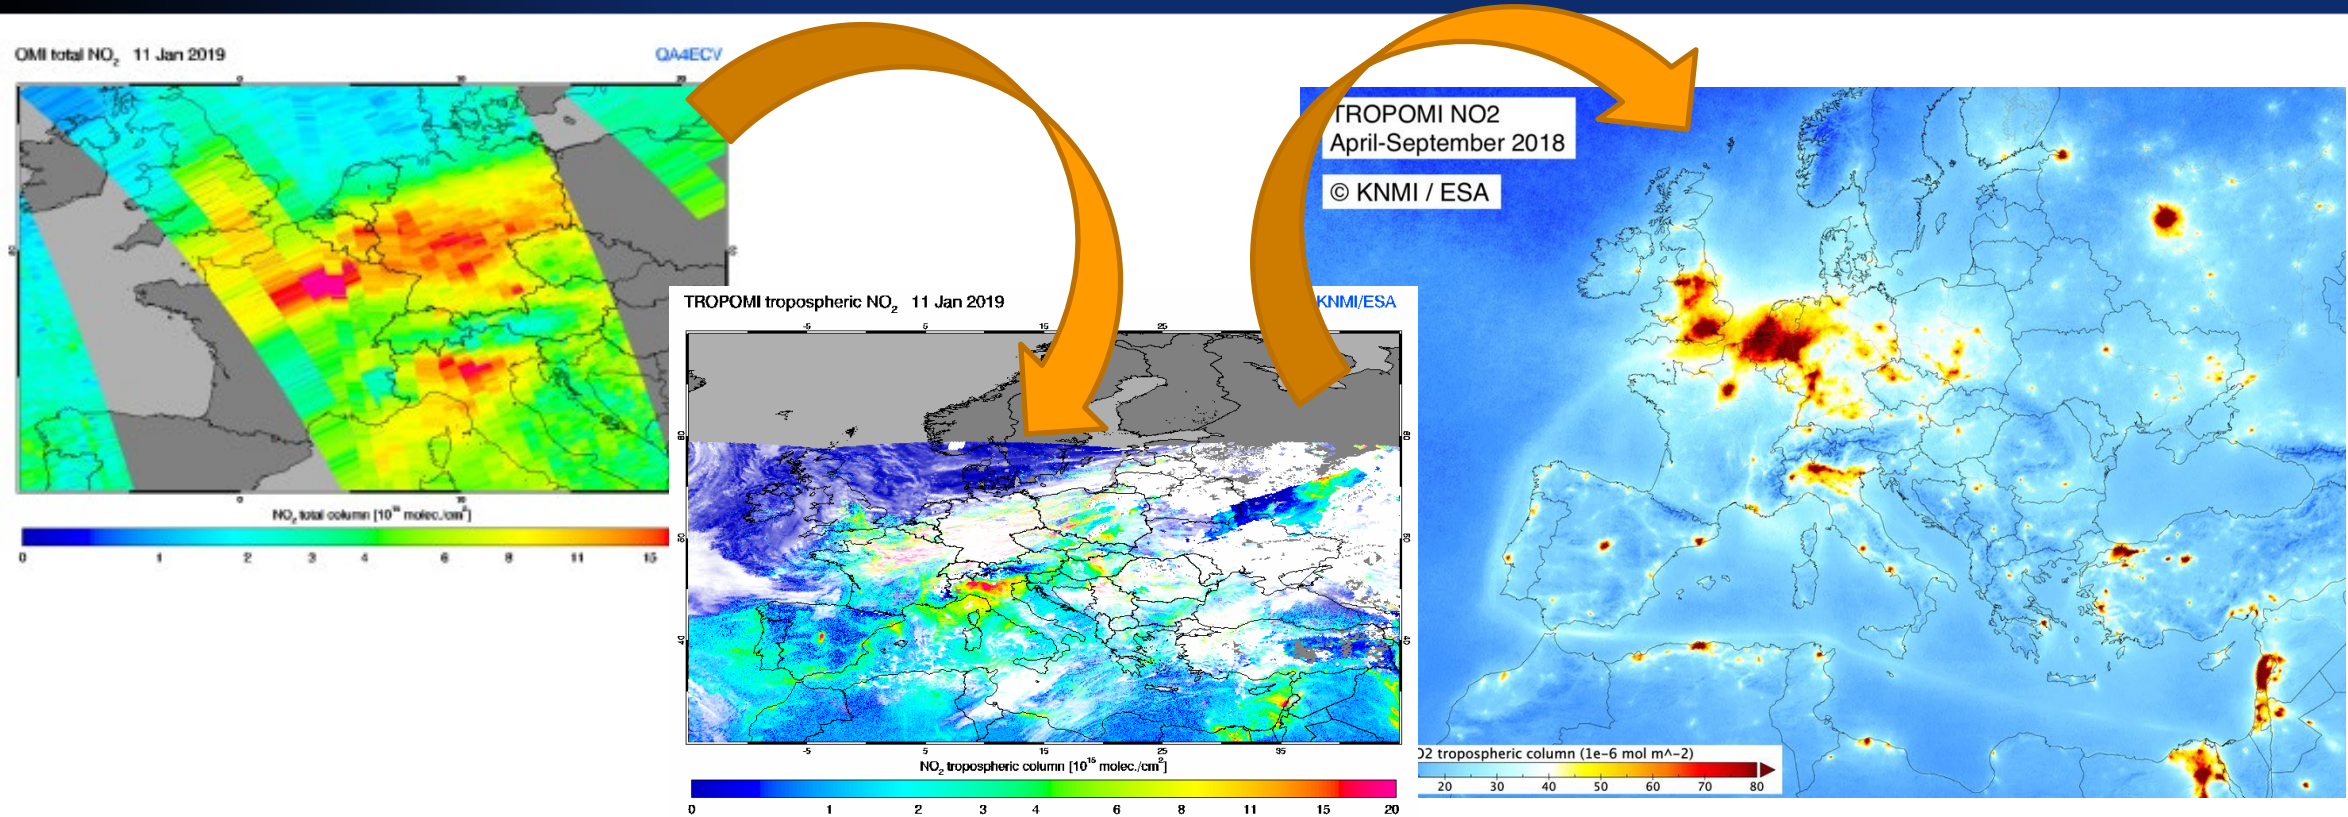

Sentinel 5 & 5P

Sentinel 4

NO₂ seen from satellite

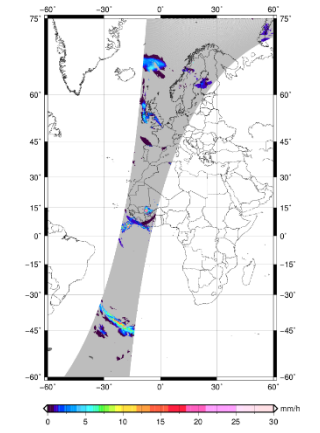

Nitrogen dioxide is an important pollutant who act both as precursor and harmful gas, mainly as a result of human activity. Product of burning. Traces also from lightning ([IPCC 2013](#)).

MTG data Application – improving H-SAF Rain estimation

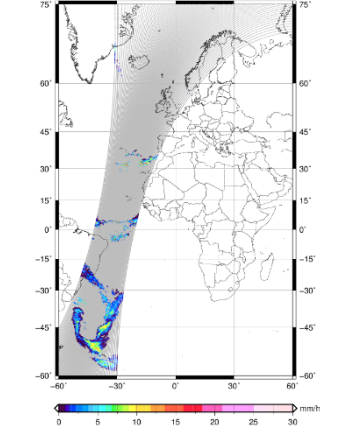

H-SAF Objective: to provide satellite-derived products from existing and future satellites with sufficient time and space resolution to satisfy the needs of operational hydrology; identified products

MTG data Application (HSAF Rain estimation)

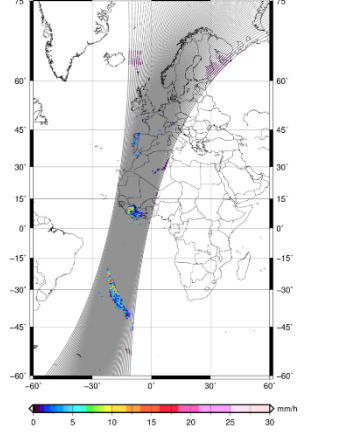

H01 – P-IN-SSMIS

H02 – P-IN-MHS

H18 – P-IN-ATMS

Future

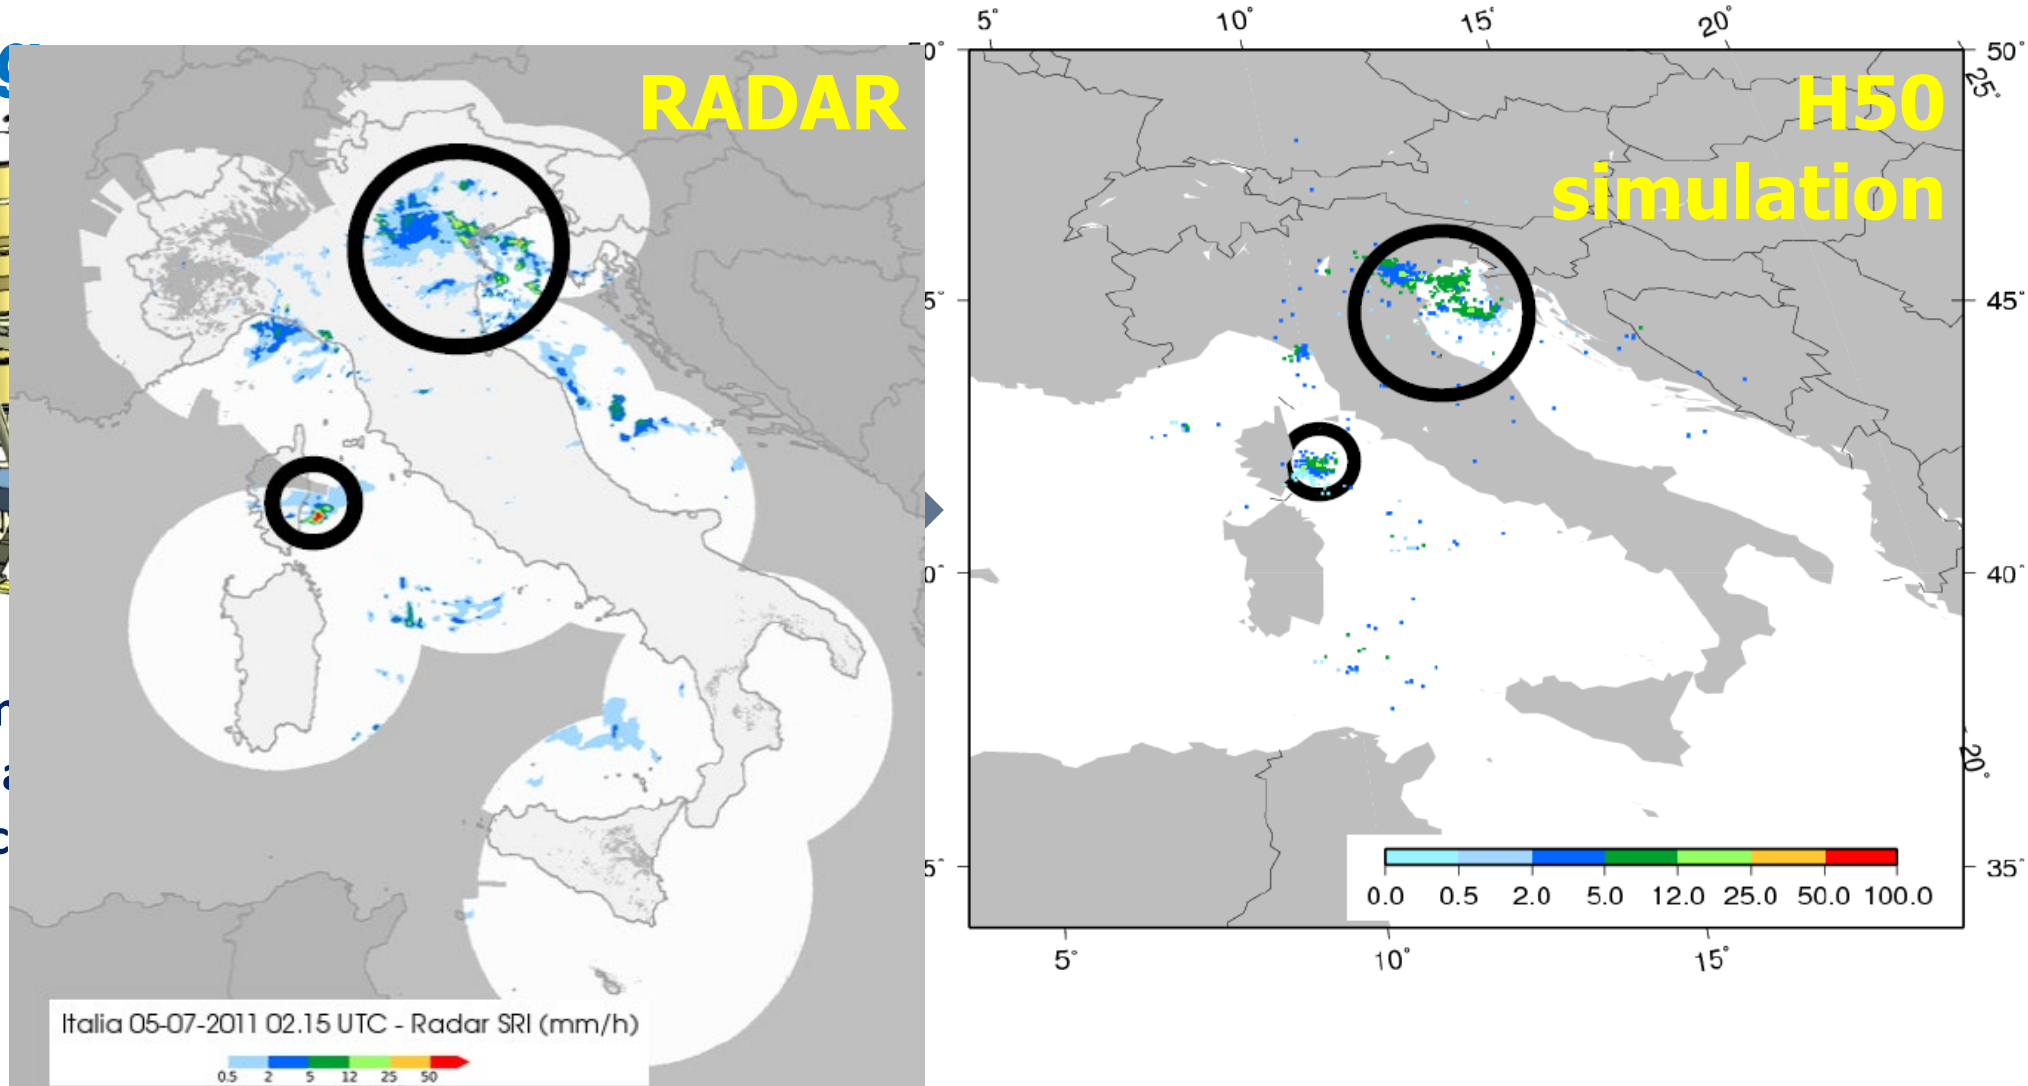

MTG data Application (HSAF Rain estimation)

MTG – Lightning Imager

Lightning data contain rainfall estimation, mainly where MW retrieval is possible

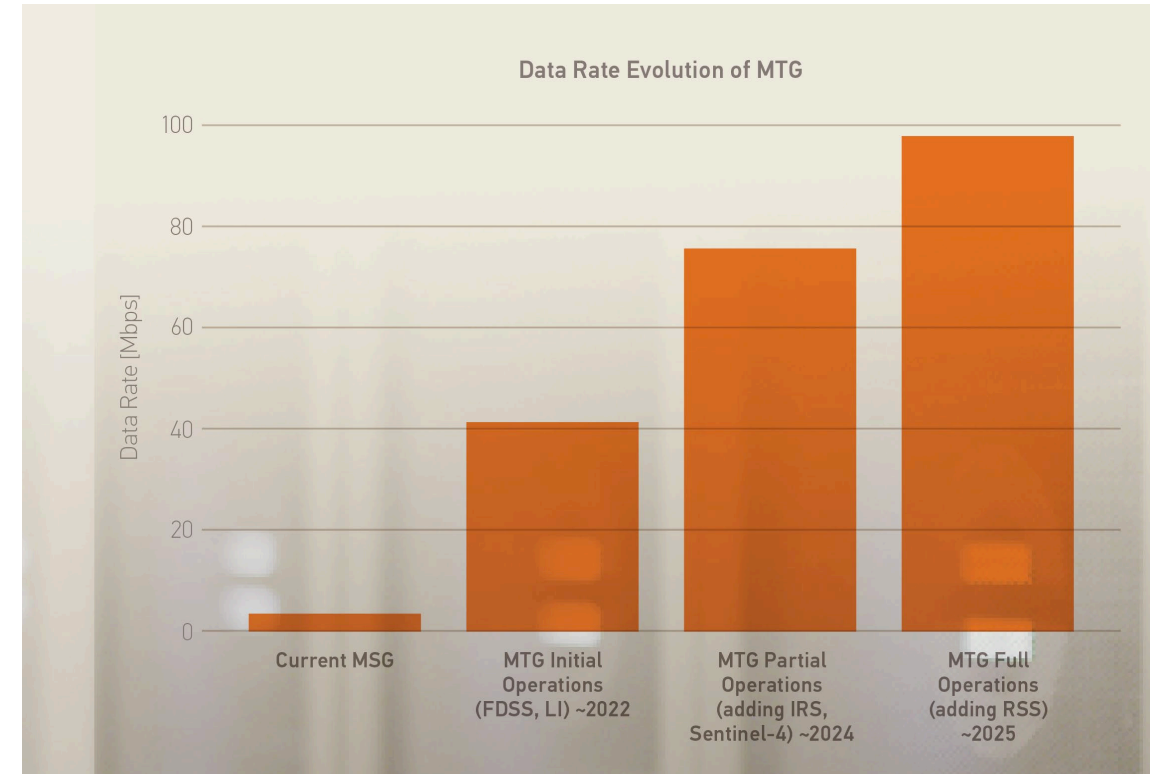

Future

Getting ready for MTG: A National Perspective

National technical infrastructure and resources are fit-for-purpose, in terms of :

increased data rates and volume and handling the novel data streams and their format in data processing and visualisation systems

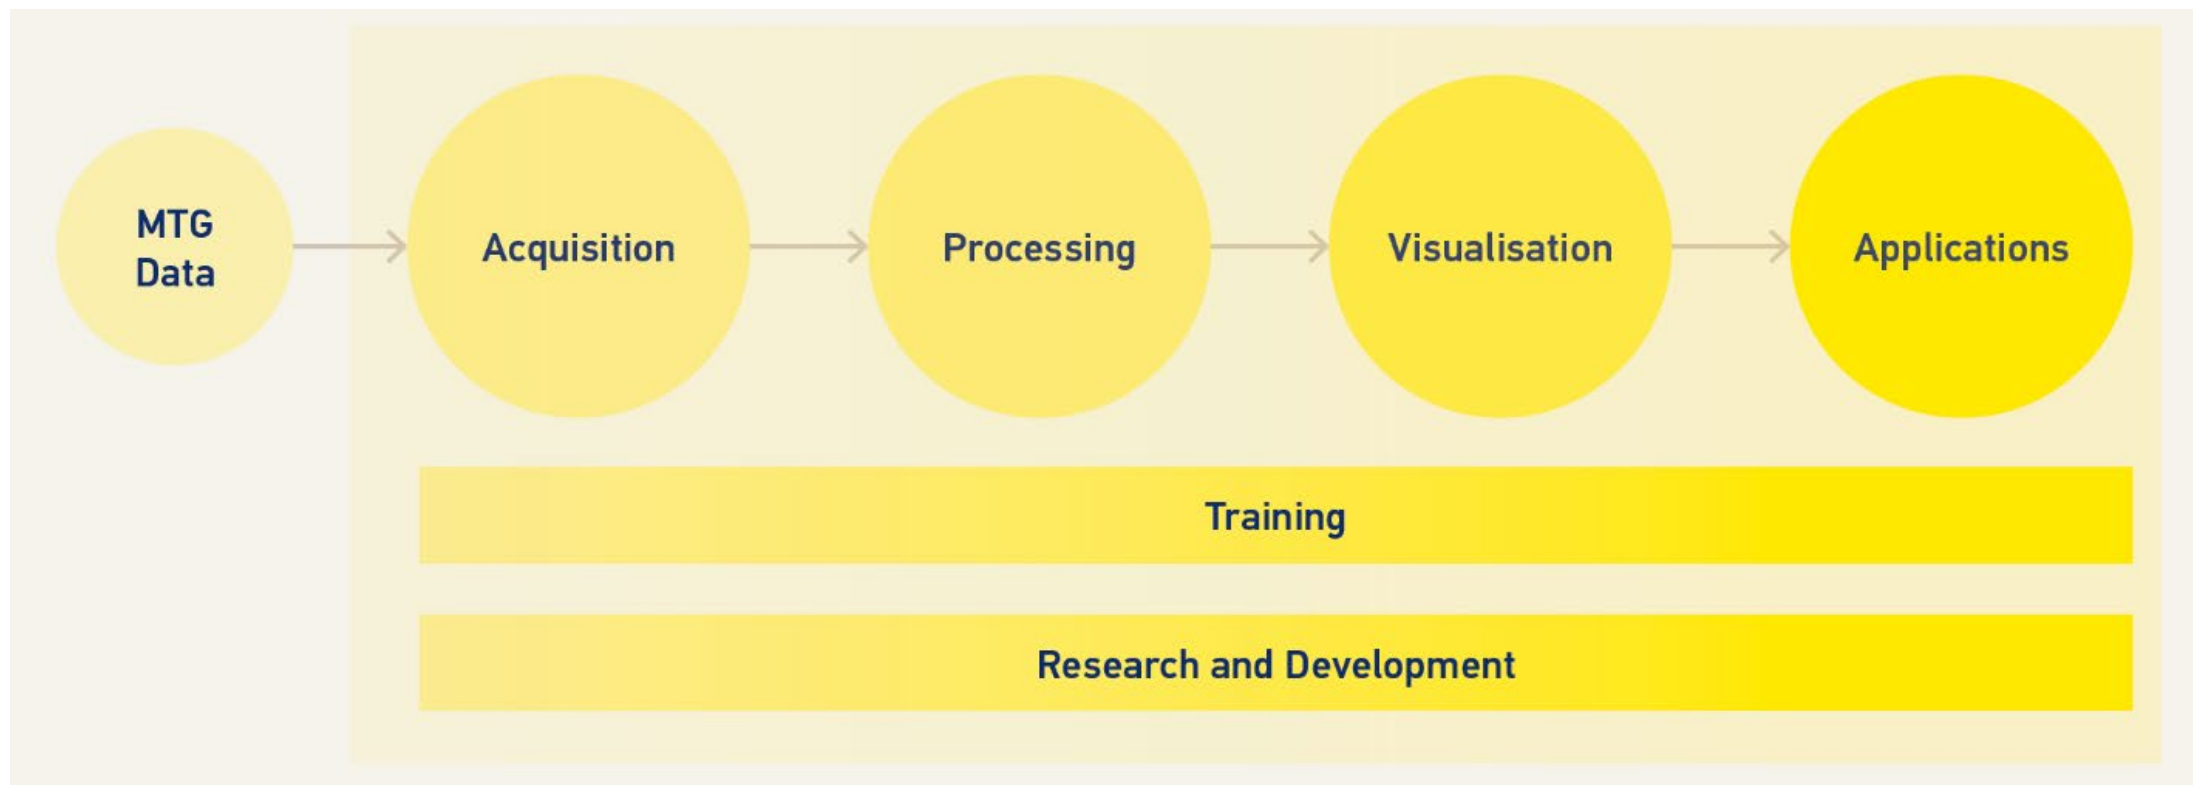

adapting local software, algorithms and products to MTG data & ingesting MTG data and products into applications

→ **Several Member State NMHS have started user preparedness projects to address these issues.**

User preparedness projects to (1) identify national priorities (2) define necessary scientific and technical developments (3) secure national resources (WMO, 2017).

Getting ready for MTG: A National Perspective

MTG-related data value chain, to guide the adequacy assessment of national infrastructure, and related investments.

How EUMETSAT can help

User Support

The EUMETSAT User Service Helpdesk can answer your questions regarding MTG. Contact our team at ops@eumetsat.int

Training

Specific training programme based on consolidated experience

https://twitter.com/eumetsat_users or contact ops@eumetsat.int

Short term exchange program

MTG User Preparation Project (MTGUP)

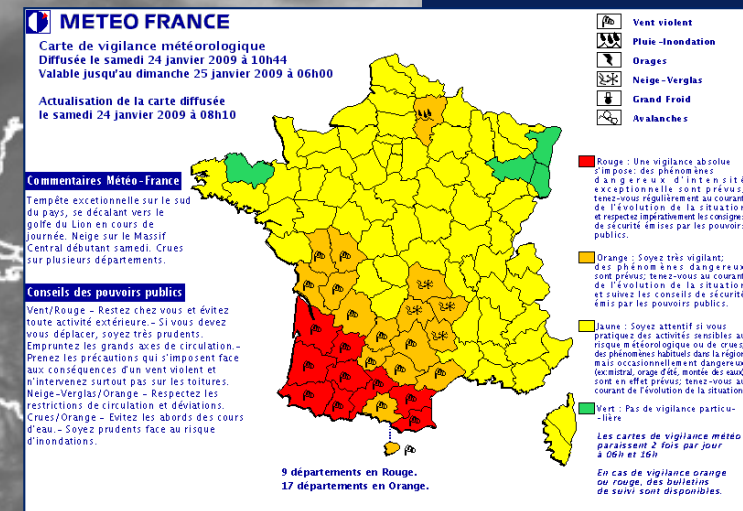

Fostering cross-institutional exchange of experience and collaboration on science, information, data access, familiarisation

<https://www.eumetsat.int/website/home/Satellites/FutureSatellites/MeteosatThirdGeneration/MTGResources/index.html>

In 2019 simulated data by EUMETSAT:
FCI Level 1c data for format – Upcoming !
IRS Level 1b data for format familiarisation
LI Level 2 data for user familiarisation

MTG enhances current capability for confirming forecasts

Future FCI

Benefits from the MTG Imager (FCI)

- New channels (0.444 μm and 0.51 μm) will support **true colour images** and permit surpassing current **aerosol retrievals** especially over land – also an important contribution to air quality monitoring.
- The 0.91 μm channel will provide during **daytime total column precipitable water** especially over land surfaces.
- The 1.375 μm channel will improve detection of **very thin cirrus clouds** not seen by the current system. If not detected, errors are introduced in all clear sky products.
- The 2.26 μm channel will provide the capability for an **improved retrieval of cloud microphysics**.
- The higher spatial resolution (1 km and 2 km) of the 3.8 μm channel will **improve fire detection** and, via its extended dynamical range (from 350 K to 450 K), the quality of products.
- To **improve the convection detection** through the shorter repeat cycle and better spatial resolution.

MTG lightning imager mission: *Why do we care?*

- Lightning is a precursor of severe weather, with a lead time of tens of minutes
- Most ground-based lightning location systems are mainly sensitive to cloud-to-ground lightning (CG)
- Often, no increase in CG due to “weather intensification” observable
→ Total lightning is the parameter of interest

**Total lightning =
cloud-to-ground
+ cloud-to-cloud lightning**

MTG Infra-Red Sounder (IRS)

4 Local Area Coverage (LAC):

- One LAC acquired within 15'
- Overlapping step & stare dwells
- 160x160 pixels, ~4km at Nadir
- Europe (LAC 4) observed every 30'

**Major innovation:
Operational spectro-
imagery at high spectral,
spatial & temporal
resolution**

MTG-S: Monitoring atmospheric composition

- The second instrument aboard MTG-S: the Ultraviolet Visible Near-infrared (UVN) spectrometer – *Copernicus Sentinel-4*
- This mission covers the need for continuous monitoring of atmospheric composition / chemistry.
- **Focus on air quality with the main data products being O₃, NO₂, SO₂, HCHO, and aerosol optical depth.**
- Spatial sampling at 45° North: 8 x 8 km²
- Temporal resolution: 60 min.
